

# Types of uav's

All the drones in the database are quadcopters, this means that all of them are controlled by four rotors, varying only the body and the color.

I have detected four different uav listed below. The last two are not so common so we don't have a lot of images to give you as examples.

- 1) Type 1: DJI Phantom 4. This uav is the most common in the database, until now, they are all white, but there are some other colors in the market.

- 2) Type 2: DJI Mavic Air Onyx. This uav is the second more common in the database, all of them black or in dark colors. It is flatter in relation to the other uav's

- 3) Type 3: DJI Mavic Pro 4K. This type of drone is not so common in the database and could be easily mistakable with the previous uav. The difference lies in the position of the propellers.

- 4) Type 4: DJI Inspire 2 Cinema Premium. The last type is the less common and it is characterized for the size of its arms, where the propellers are installed.
